

Shapley R^2 decomposition
Preferred tax rate on the top 1% (Alesina, Stantcheva & Teso 2018)

Full model $R^2 = 0.099$, $N = 1,986$ (*complete-case*)

By variable

#	Variable	% R^2
1	everybody in the US has a chance to make it	17.6%
2	why a person is rich: harder work vs. more advantages	16.1%
3	why a person is poor: lack of effort vs. circumstances	12.6%
4	age in years	11.3%
5	whether govt has ability/tools to reduce unequal opportunity	10.7%
6	perceived chance a poor child reaches 4th quintile	10.0%
7	perceived chance a poor child reaches top quintile	8.0%
8	perceived chance a hard-working poor child reaches 4th quintile	6.4%
9	perceived chance a hard-working poor child reaches top quintile	4.8%
<i>— variables with <3% contribution omitted —</i>		

By cluster

#	Cluster	% R^2
1	perceived mobility / opportunity	46.7%
2	wealth from effort/merit	16.1%
3	deservingness of poor	12.6%
4	age	11.3%
5	government capability	10.7%
<i>— clusters with <5% contribution omitted —</i>
